Basic principles for selection of fluid administration volume and rate in veterinary medicine By: Duncan C. Ferguson, VMD, PhD, DACVIM, DACVCP.

### **Fluid Therapy I: Volume, Rate and Route**

The body is made up of around 60–70% water. 1 Of this fluid, 1/3 is extracellular and 2/3 is intracellular. Of the extracellular fluid, approximately  $\frac{3}{4}$  is interstitial and  $\frac{1}{4}$  is intravascular. Fluids move between the various compartments depending on various forces. 1 In certain disease states, fluid deficiencies may occur in one or all of these fluid compartments and fluid therapy is used ...

Animals may require fluid therapy for numerous reasons, including restoration of intravascular volume, correction of dehydration, treatment of electrolyte disturbances (beyond the scope of this article) or simply when the animal is not able to match its daily fluid requirements with adequate food and/or water intake.

### **Companion animal fluid therapy part 2: planning and monitoring**

Fluid therapy should be based on calculation of degree of dehydration (to be replaced over 4-8 hr if there is no contraindication), maintenance, and ongoing losses (eg, due to vomiting or diarrhea). In those few cases in which the cause is known, specific therapy against the inciting cause may be initiated.
